

### Difference B/W Api And Web Api

TCP, SMTP, HTTP

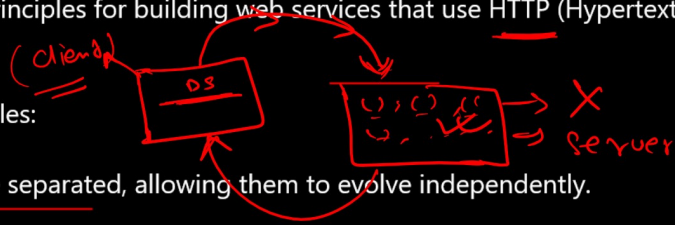

HTTP

### Rest And Soap Architecture

RESTful services, also known as RESTful APIs, are web services that follow the REST architectural style. REST stands for Representational State Transfer, which is a set of principles for building web services that use HTTP (Hypertext Transfer Protocol) as the communication protocol.

RESTful services are based on the following principles:

Client-server architecture: The client and server are separated, allowing them to evolve independently.

Stateless: Each request sent to the server contains all the information needed to complete the request. The server does not maintain any client context between requests.

Cacheable: Responses from the server can be cached to improve performance.

Uniform interface: RESTful services use a uniform interface consisting of resources, HTTP verbs (GET, POST, PUT, DELETE), and hypermedia links.

Layered system: RESTful services can be composed of multiple layers, allowing for scalability, flexibility, and security.
